

Declaración de Lanzarote

21 de Junio del 2016

MICRO 2016

Fate and Impact of Microplastics in Marine Ecosystems: From the Coastline to the Open Sea

Declaración de Lanzarote

21 de Junio del 2016

Los días 25, 26 y 27 de mayo se celebró MICRO 2016 la primera conferencia internacional sobre los microplásticos realizada en la Reserva de la Biosfera de Lanzarote, Canarias, España. Tomados como origen el taller MICRO 2014 de Plouzané, Francia y el seminario MICRO 2015 en Piran, Eslovenia, MICRO 2016 ha sido la oportunidad de compartir el conocimiento disponible, identificar cuestiones emergentes e implicar a la comunidad científica en la **Declaración de Lanzarote**.

La **Declaración de Lanzarote** parte de esfuerzos a nivel regional, nacional e internacional como, por ejemplo: la Convención de Londres (1972); la Convención de Barcelona (1976); la Convención MARPOL (1978); el Plan de Acción de los Mares del Asia Oriental (1981); la Convención de Abidjan (1984); la Convención de Cartagena (1986); la Convención de Bâle (1989); la Convención OSPAR (1992/1998/2002/2005/2006/2007); el Plan de Acción del Noroeste del Pacífico (1994); la Convención de Nairobi (1996); la Directiva Europea Marco de actuación en el ámbito de la política de Aguas (2000); la Convención de Teherán (2003); La Directiva Europea Marco sobre la estrategia marina (2008); el Compromiso de Honolulu (2011); la Declaración de Manila (2012); el Plan Regional de Basura Marina del Mediterráneo (2014) y la Declaración de los Líderes del G7 (2015).

El plástico participa en casi todos los aspectos de nuestra vida cotidiana. Los plásticos son versátiles, ligeros, persistentes, baratos y pueden adoptar casi cualquier forma. Mientras que estos son rasgos valiosos, el carácter desechable que ha ido tomando este material en las últimas décadas impacta la mayoría de los ecosistemas del Planeta. Se han encontrado plásticos en la atmósfera, suelos, agua dulce, mares, océanos y regiones polares. Se ha reconocido un nuevo ecosistema el “plastisferio”, como consecuencia de su aumento exponencial y duradero en los ecosistemas. La inquietud sobre este tipo de polución aumenta sin cesar debido entre otras razones a su aún poco conocido impacto a nivel de organismo y de su impacto potencial a nivel de ecosistema. La mayoría de los plásticos son considerados materiales persistentes, ya que no se mineralizan, acumulándose en la biosfera, cada vez más y más, en fragmentos de tamaño cada vez menor.

Los microplásticos son definidos generalmente como aquellos de diámetro inferior a 5mm, y tienen dos orígenes posibles: (i) microplásticos primarios, que incluyen por ejemplo: abrasivos industriales, exfoliantes, cosméticos, grazna de producción, y (ii) microplásticos secundarios, que provienen de la degradación de fragmentos mayores.

Aunque la presencia de microplásticos en el medio ambiente fue documentada en los años 70', muchísimas preguntas sobre su impacto siguen sin respuesta.

Nosotros, los 46 miembros del comité científico de MICRO 2016, firmamos la **Declaración de Lanzarote** en nombre de los 632 participantes en las 200 comunicaciones presentadas durante la conferencia. A partir de este material científico y técnico en esta declaración resumimos los puntos más remarcables, nos posicionamos como comunidad científica y establecemos el primer hito para el proceso colaborativo que nos llevará a **MICRO 2018**.

Declaración de Lanzarote

21 de Junio del 2016

Puntos más remarcables de MICRO 2016:

Esta declaración cubre todos los tipos de microplásticos.

Existe una necesidad de mantener y mejorar la relación entre los esfuerzos en investigación y las políticas públicas a nivel regional, nacional e internacional como: OSPAR, NOWPAP, MEDPOL, la Directiva europea marco sobre la estrategia marina, etc.

Se han encontrado microplásticos en casi todos los lugares investigados de mares, océanos y zonas costeras del Planeta, incluyendo los lugares más remotos del Planeta. Aunque menos investigadas, también se han encontrado en masas de agua dulce y medioambientes terrestres.

La presencia masiva de microplásticos y su impacto ha sido demostrada por más de 50 investigaciones alrededor del mundo.

Se ha demostrado por muchas investigaciones que los microplásticos son ingeridos por diversas especies y el riesgo de transferencia a los humanos ha sido evidenciado gracias al estudio en especies comerciales de peces, moluscos y crustáceos. Las algas también han sido identificadas como un vector de transmisión de los microplásticos a la cadena trófica.

La coincidencia entre las zonas de alta concentración de microplásticos con zonas de alimentación de organismos acuáticos es alarmante. Este hecho ha sido particularmente demostrado en poblaciones de rorcuall común del Mediterráneo, mamíferos varados en Irlanda, tortugas de Chipre y de las Islas Canarias, y numerosas especies de aves.

La escorrentía superficial se ha evidenciado de forma robusta como un vector significativo de transporte de microplásticos, particularmente desde las carreteras en áreas pobladas. Varios estudios confirman alta concentración de microplásticos en lodos de las estaciones depuradoras, poniendo en evidencia la necesidad de mejorar las condiciones de las plantas de tratamiento de aguas residuales y el conjunto del ciclo del agua en zonas altamente pobladas.

De estudios anteriores que identificaban comunidades microbianas en la superficie de algunos plásticos, nuevos estudios confirman este hecho y aportan datos sobre las características y evolución en el tiempo de estas comunidades microbianas.

La modelización aparece como una herramienta complementaria fundamental para identificar las fuentes, los recorridos y los sumideros potenciales de microplásticos.

El aumento de las investigaciones sobre nano-plásticos confirma el impacto de la degradación del plástico en tamaños ínfimos y la necesidad de mejorar la comprensión de esta nueva temática.

Para integrar los datos de los diferentes trabajos y proyectos necesitamos: (i) estandarizar la identificación y cuantificación de microplásticos; y (ii) explicitar las técnicas y metodologías utilizadas en los estudios no estandarizados. Existe igualmente una clara necesidad de armonizar las metodologías entre la ciencia profesional y ciudadana, teniendo presente la importancia de los beneficios colaterales por compartir metodologías, resultados y procesos.

La ciencia ciudadana contribuye al muestreo y monitoreo de los microplásticos. Los esfuerzos en participación y educación para mejorar la concienciación sobre el impacto de los microplásticos, contribuyen de forma inestimable en la mejora de la conexión entre el público en general y esta problemática. Percepciones y representaciones pueden cambiar gracias a la concienciación.

Trabajar para prevenir y mitigar la polución por microplásticos aporta beneficios más allá de reducir la polución y recuperar la integridad del medioambiente, como pueden ser la mejora de la salud pública y calidad de vida.

Declaración de Lanzarote

21 de Junio del 2016

Las soluciones tecnológicas como las asociadas a la mejora de los procesos de reciclaje y a la reducción de materiales dañinos son necesarias, junto a la sustitución del plástico por materiales naturales biodegradables.

Debido al aumento de evidencias de las consecuencias medioambientales, junto al riesgo potencial que representan los microplásticos para la salud humana, debemos considerar el nivel de responsabilidad de la industria en el impacto de los microplásticos.

Acciones inmediatas son posibles y necesarias.

A partir de estos puntos y del conjunto del material compartido durante MICRO 2016 (ver Anejo I con el programa completo), declaramos que:

Existe una profunda preocupación por parte de la comunidad científica sobre los microplásticos, que están afectando claramente el conjunto de la biosfera.

Como consecuencia del aumento de la cantidad de microplásticos acumulados en el medioambiente, tenemos la obligación de compartir las investigaciones presentadas en MICRO 2016 y expandir nuestros horizontes de investigación. Para eso necesitamos colaboración y cooperación, a todas las escalas de local a global, entre todos los sectores y disciplinas, para mejorar el conocimiento, educación y concienciación. Estos procesos no deben retrasar la acción.

Con esta declaración reconocemos nuestra responsabilidad como individuos para cambiar nuestro comportamiento en lo relativo a la producción y al consumo de microplásticos, así como nuestra obligación de informar al conjunto de la sociedad de las implicaciones ambientales, económicas y de salud pública evidenciadas por los resultados de las investigaciones presentadas en MICRO 2016.

Nosotros, los 46 miembros del comité científico, en nombre de los 632 participantes en las 200 comunicaciones presentadas en MICRO 2016, como representantes de la comunidad científica, hacemos un llamamiento al conjunto de la sociedad, al sector privado y al sector político para tener en cuenta la presente declaración y pasar del conocimiento a la acción.

Esta declaración marca el primer hito del proceso colaborativo de **MICRO 2018**.

Lanzarote Declaration
21st June 2016

MICRO 2016

Fate and Impact of Microplastics in Marine Ecosystems: From the Coastline to the Open Sea

Lanzarote Declaration

21st June 2016

From May 25-27, the MICRO 2016 international conference on microplastics was held in the UNESCO Biosphere reserve of Lanzarote, Canary Islands, Spain. Rooted in the MICRO 2014 international workshop in Plouzané, France and the MICRO 2015 seminar in Piran, Slovenia, MICRO 2016 provided an opportunity to share available knowledge, fill in gaps, identify new questions and engage the scientific community through the work presented and the **Lanzarote Declaration**.

We recognize that the **Lanzarote Declaration** stems from previous regional, national, and international efforts such as: The London Convention (1972); the Barcelona Convention (1976); the MARPOL Convention (1978); the East Asian Seas Action Plan (1981); the Abidjan Convention (1984); the Cartagena Convention (1986); Bâle Convention (1989); the OSPAR Convention (1992/1998/2002/2005/2006/2007); the Northwest Pacific Action Plan (1994); the Nairobi Convention (1996); EU Water Framework Directive (2000); the Teheran Convention (2003); EU Marine Strategy Framework Directive (2008); the Honolulu Commitment (2011); the Manila Declaration (2012); the Mediterranean Regional Plan on Marine Litter (2014); and the G7 Leaders' Declaration (2015).

Nearly all aspects of our daily lives involve plastics. Plastics are versatile, light, durable, inexpensive and can be shaped to almost any form imaginable. While these are valuable traits, the “disposable” use of plastics in recent decades is now clearly visible in the majority of Earth's ecosystems. Plastics have been found in the atmosphere, soils, fresh water, oceans, seas, and polar regions. They are even recognized as new habitat for organisms, called the Plastisphere. As they become increasingly prevalent in ecosystems, concerns about plastics are mounting due to their unknown effects at the organismal level and potential consequences for ecosystem functioning. Most plastics are considered persistent material and accumulate in the environment since they cannot be mineralized. Over time we find increasing numbers of fragments of decreasing size.

Microplastics are generally defined as any plastic particles less than 5 mm and they come from two sources: (i) primary microplastics, which include industrial abrasives, exfoliants, cosmetics and pre-production plastic pellets; and (ii) secondary microplastics, which come from the degradation of larger processed plastic items.

While the presence of microplastics in ecosystems has been reported in the scientific literature since the 1970's, many pressing questions regarding their impacts remain unresolved.

We, the 46 members of the Scientific Committee, sign the **Lanzarote Declaration** on behalf of 632 researchers whose work comprised over 200 presentations at the MICRO 2016 conference. Drawing from the shared scientific and technical material, in this declaration we summarize the highlights from MICRO 2016 and mark the first milestone of the **Road to MICRO 2018** collaborative process.

Lanzarote Declaration

21st June 2016

Highlights from the MICRO 2016 conference:

This declaration covers any type of microplastic.

There is a need to maintain and improve the link between ongoing research and policy efforts at national and international levels such as the EU Marine Strategy Framework Directive, OSPAR, NOWPAP, MEDPOL, etc.

Microplastics are found nearly everywhere that has been investigated in the world's oceans and coastal areas, including the most remote parts of the earth. Though less studied, they are also found in fresh water bodies and terrestrial environments.

The widespread occurrence of microplastics and their impacts have been demonstrated by more than 50 studies worldwide.

As demonstrated by several studies, microplastics may be ingested by many species, and the risk of transfer to humans has been shown for some commercial species such as fish, mollusks and crustaceans. Seaweed has also been shown as a vector for microplastics.

Studies show the overlap of aquatic biota feeding grounds and waters with high levels of microplastic pollution. This has particularly been demonstrated for: fin whales in the northwestern Mediterranean Sea, marine mammals stranded in Ireland, turtles in Northern Cyprus, turtles in the Canary Current, and seabirds.

Runoff has been robustly demonstrated as a significant microplastic vector, particularly road runoff in populated areas. Several studies confirm sewage sludge as a vector of microplastic pollution, highlighting the need for further studies and actions focused on sewage treatment plants and the urban water cycle.

From previous studies finding microbial communities on plastic surfaces, new results confirm plastisphere microbial communities and provide site-specific insight into these communities and their successional changes over time.

Modeling is clearly a fundamental and complementary tool for identifying microplastic sources, distribution paths and potential sinks.

Recent studies have confirmed that large plastic items and microplastics can be further degraded into nano-sized plastic particles, which may impact the biosphere. The largely unstudied field of nanoplastic pollution will potentially be of significant importance in years to come.

In order to integrate data across various studies and ongoing projects, we must: (i) standardize the identification and quantification of microplastics, and (ii) explicitly describe the techniques and methods currently used in ongoing, non-standardized studies. There is also a clear need to standardize and harmonize approaches for professional and citizen science efforts, keeping in mind the importance of documenting the co-benefits of citizen science and the need for standardized databases and interfaces to share the results of citizen science work.

Citizen science contributes to microplastics sampling and monitoring. Outreach and education efforts to raise awareness about microplastics in marine environments and increase ocean and plastic literacy help connect the general public with the issue of microplastics. Perceptions and representations can be changed through science communication.

Lanzarote Declaration

21st June 2016

Working to prevent and mitigate microplastic pollution provides co-benefits beyond pollution reduction and environmental integrity, such as improving human health and well being.

Technological solutions such as improving recycling processes and developing non-harmful material degradability are needed, along with replacement by natural biodegradable materials.

With growing evidence of environmental consequences and potential threats to human health, we must consider industry's level of responsibility for the impacts of plastics.

Immediate actions are needed and possible.

Given these findings and the material shared at MICRO 2016 (see Appendix I for full programme), we declare:

There is profound concern on the part of the scientific community about microplastics, which are clearly impacting the biosphere.

In recognition of the fact that microplastics continue accumulating and increasing, we must address the questions raised through the research presented here and continue expanding our knowledge horizons. This requires collaboration and cooperation, at all scales, from local to global, spanning sectors and disciplines, to improve knowledge, education and outreach efforts. This should not delay action.

With this declaration, we recognize our responsibility as individuals to change our behaviors related to plastic production and consumption, and to inform others of the social, economic and environmental implications highlighted by the research shared at MICRO 2016.

As representatives of the scientific community, we urgently call upon society, the private sector and policymakers to move from knowledge to action.

This declaration marks the first milestone of the **Road to MICRO 2018** collaborative process.

Appendix I

25TH, 26TH AND 27TH MAY 2016

MICRO2016 LANZAROTE

INTERNATIONAL CONFERENCE

Conference Programme

MICRO 2016 is an initiative of the Lanzarote Biosphere Reserve within the UNESCO MAB programme and the network of scientists Marine Sciences For Society.

Lanzarote, May 2016

Word of Welcome

We are pleased to welcome the scientific community and stakeholders to MICRO 2016, a three-day international conference, hosted in Lanzarote, Canary Islands, Spain 25 - 27 May 2016:

Fate and Impact of Microplastics in Marine Ecosystems: From the Coastline to the Open Sea

Nearly all aspects of daily life involve plastics, and the production of plastics has increased significantly in recent decades. Plastic is widely used since it is versatile, light, durable and “cheap”. These same qualities allow it to travel over long distances across oceans and seas if we do not manage it carefully. Consequently, plastic is becoming an ever-increasing problem due to its low production cost, potential toxicity and universal presence. Plastics are persistent materials, which tend to accumulate in the marine environment from coasts to the open sea.

Microplastics (MPs) are defined as all plastic particles less than 5 mm and come from two sources: (i) primary MPs, which include industrial abrasives, exfoliants, cosmetics and pre-production plastic pellets; (ii) secondary MPs, which come from the fragmentation of plastics.

MPs can contain additives such as UV-stabilizers, colourings, flame retardants and plasticizers, which are transported by the plastic pieces and are susceptible to being taken up by living organisms. These plastics can accumulate persistent organic pollutants (POPs) from the environment and facilitate their transfer into marine food webs. They can also be a vector for invasive species and harmful pathogens.

Although impacts of MPs in marine ecosystems have been reported in the literature since the 70's, many questions still remain open.

MICRO 2016 provides an opportunity to share available knowledge, fill in gaps, identify new questions and research needs, and develop commitments to operationalize solutions.

Thanks to everyone who submitted abstracts.

**The high quality of the scientific material and
the engagement of the Organizing Board and Scientific Committee
allow us to Welcome You to MICRO 2016.**

The members of the Organizing Board and Scientific Committee:

Reserva de la Biosfera de Lanzarote, Cabildo de Lanzarote: **Ana Carrasco and Aquilino Miguelez.**
Observatoire de Versailles SQY: **Juan Bartzan, Mateo Cordier and Jean-Paul Vanderlinden.**
Plymouth University: **Sabine Pahl and Richard Thompson.**
CNRS: **Thierry Huck, Ika Paul Pont and Philippe Soudant.**
Universitat Politècnica de Catalunya: **Agustín Sánchez-Arcilla.**
Instituto Español de Oceanografía: **Jesús Gago and Luis Valdés.**
ULPGC: **Ana Liria, May Gomez, Alicia Herrera and Ted Packard.**
CSIC: **Elisabetta Broglio and Joaquim Garrabou.**
UNAM: **Ana Carolina Ruiz.**
IFREMER: **François Galgani and Arnaud Huvet.**
Université de Moncton: **Omer Chouinard and Céline Surette.**
Universidad de Cádiz: **Andrés Cozar and Abelardo Gómez Parra.**
Instituut voor Landbouw-en Visserijonderzoek: **Lisa Devrieses and Johan Robbens.**
National Institute of Chemistry: **Andrej Kržan.**
Cornell University: **Bethany Jorgensen.**
Université Libre de Bruxelles: **Didier Peeters.**
Alfred Wegener Institute: **Melanie Bergmann, Gunnar Gerdts and Lars Gutow.**
The University of Maine: **Jeffrey Runge.**
NUI Galway: **Amy Lusher.**
Université du Maine: **Fabienne Lagarde.**
Universidade Federal de Pernambuco: **Monica Ferreira da Costa and Juliana A. Ivar do Sul.**
Università degli Studi di Siena: **Maria Cristina Fossi.**
SINTEF: **Andy Booth.**
Latvijas Universitate: **Raimonds Ernsteins.**
National Oceanic and Atmospheric Administration: **Carlie Herring and Nancy Wallace.**
UNESCO Intergovernmental Oceanographic Commission: **Henrik Enevoldsen.**
UNESCO MaB: **Miguel Clüsener-Godt.**

Are glad to Welcome you and wish you a great conference.

MICRO 2016 Programme

May 25th 2016

8h30-9h30 **Registration**

9h30-10h Welcome and Official Opening

10h-11h20 Session I. **Chair persons:** Arnaud Huvet and Mateo Cordier.

Coffee break 20'

11h40'-13h Session II. **Chair persons:** Miguel Clüsener-Godt and Jesús Gago.

13h-15h Lunch break, please see the map for options or ask the Organizing Team

15h-16h10 Session III. **Chair persons:** May Gomez and Alicia Herrera.

Coffee break 20'

16h30-17h30 Session IV. **Chair persons:** Maria Cristina Fossi and Ana Liria.

17h30-19h Posters and side event “Education”

19h-20h30 Session V. **Chair persons:** Sabine Pahl and Jean-Paul Vanderlinden.

Discussion and conclusions

21h Social event: **Theater performance "Tortuga y el mar"** at the Teatro Insular, Rambla Medular 65, Arrecife

May 26th 2016

9h-10h30 Session VI. **Chair persons:** Lars Gutow and Fabienne Lagarde.

Coffee break 30'

11h-13h Session VII. **Chair persons:** Gunnar Gerdts and Johan Robbins.

13h-15h Lunch break, please see the map for options or ask the Organizing Team

15h-16h10 Session VIII. **Chair persons:** Melanie Bergmann and Juan Baztan.

Coffee break 20'

16h30-17h30 Session IX. **Chair persons:** Elisabetta Broglio and Ted Packard.

17h30-19h Posters

19h-20h30 Public keynote: “Dialogue between natural and social sciences”

By François Galgani and Jean-Paul Vanderlinden.

20h30 Informal dinner for registered participants

May 27th 2016

9h-10h30 Session X. **Chair persons:** Céline Surette and Quino Miguelez.

Coffee break 30'

11h-13h Session XI. **Chair persons:** Andrej Kržan and Bethany Jorgensen.

13h-15h Lunch break, please see the map for options or ask the Organizing Team

15h-16h10 Session XII. **Chair persons:** Andy Booth and Raimonds Ernsteins.

Coffee break 20'

16h30-17h30 Session XIII. **Chair persons:** Amy Lusher and Omer Chouinard.

17h30-19h Posters and side event “Sharing Responsibilities”

19h Conclusions: Lanzarote’s Declaration

MICRO 2016 Programme

MICRO 2016 Detailed Programme, May 25th 2016

8h30-9h30 Registration

9h30-10h Welcome and Official Opening

10h-11h20 Session I - Chair persons: Arnaud Huvet and Mateo Cordier.

Ia

Microplastics as Vectors of Polycyclic Aromatic Hydrocarbons (PAHs) via Chemical Adsorption and Desorption. *C. Blair Crawford et al.*

19h-20h30 Public Keynote: “Dialogue between natural and social sciences”

By François Galgani and Jean-Paul Vanderlinden.

The Poster Awards will be announced at 20h27...

20h30 Informal dinner for registered participants

May 27th 2016

9h-10h30 Session X - Chair persons: Céline Surette and Quino Miguelez.

Xa

Plastics and Zooplankton: What do we know? *P. Lindeque et al.*

Xb

Microtrophic Project. *A. Herrera et al.*

Xc

Biofouling of microplastics promotes their ingestion by marine zooplankton: implications for food web magnification and experimental design. *R. Vroom et al.*

Xd

Source to sink: Microplastics in benthic fauna in a gradient from discharge points to deep basins in an urban model fjord. *M. Haave et al.*

Xe

Uptake and toxicity of methylmethacrylate-based nanoplastic particles in aquatic organisms. *A. Booth et al.*

Xf

On the potential role of phytoplankton aggregates in microplastic sedimentation. *M. Long et al.*

Xg

Hitchhiking microorganisms on microplastics in the Baltic Sea. *S. Oberbeckmann et al.*

Xh

Microplastic Prey? – An assay to investigate microplastic uptake by heterotrophic nanoflagellates. *A. Madita Wieczorek et al.*

Xi

Microplastics in seafood: identifying a protocol for their extraction and characterization. *G. Duflos*

Coffee break 30'

11h-13h Session XI - Chair persons: Andrej Kržan and Bethany Jorgensen.

XIa

Vast quantities of microplastics in Arctic sea ice – a prime temporary sink for plastic litter and a medium of transport. *M. Bergmann et al.*

XIb

Modelling the effect of biofouling on the vertical distribution of microplastic in the oceans. *M. Kooi et al.*

XIc

Microplastics in the Bay of Brest (Brittany, France): composition, abundance and spatial distribution. *L. Frère et al.*

XId

Modelling the movement, fate and impact of microplastic debris in UK coastal waters. *J. Clark et al.*

MICRO 2016 Programme

XIe

Plastic litters: a new habitat for marine microbial communities. *C. Dussud et al.*

XIf

The effects of microplastic on freshwater *Hydra attenuata* morphology & feeding. *F. Murphy.*

XIg

Evidence of microplastic ingestion in elasmobranchs in the western Mediterranean Sea. *S. Deudero et al.*

XIh

Do microplastic particles impair the performance of marine deposit and filter feeding invertebrates? Results from a globally replicated study. *M. Lenz et al.*

XIi

Marine snows act as a vector of transport of microplastic to the benthos and change the uptake of plastics to the Blue Mussel (*Mytilus edulis*). *A. Porter et al.*

XIj

Occurrence of potential microplastics in commercial fish from an estuarine environment: Preliminary results. *F. Bessa et al.*

XIk

Microscopical investigation of polystyrene microparticles colonisation by *Vibrio crassostreae*. *V. Foulon et al.*

XII

Improvements and needs of microplastics analytical control at open sea – opportunities for monitoring at Canary Islands. *D. Vega-Moreno et al.*

13h-15h Lunch break, please see the map for options or ask the Organizing Team

15h-16h10 Session XII - Chair persons: Andy Booth and Raimonds Ernsteins.

XIIa

A novel method for preparing microplastic fibers. *M. Cole.*

XIIb

A new approach in processing freshwater suspended particulate matter for separating microplastics. *S. Hatzky.*

XIIc

Microplastics - microalgae: an interaction dependent on polymer type. *F. Lagarde et al.*

XIID

Characterization of the level and composition of floating microplastic particles in the Stockholm Archipelago. *B. Gewert et al.*

XIIe

Quantifying the impact of microscopic plastic debris on antibiotic resistance evolution. *T. Galloway.*

XIf

Nearshore circulation in the Confital Bay: Implications on marine debris transport and deposition at Las Canteras Beach. *L. McKnight Morales et al.*

MICRO 2016 Programme

XIIg

New approaches of the extraction and identification of microplastics from marine sediment. *M. Kedzierski et al.*

Coffee break 20'

16h30-17h30 Session XIII - Chair persons: Amy Lusher and Omer Chouinard.

XIIIa

Using physical and chemical characteristics of floating microplastics to investigate their weathering history. *K. Law et al.*

XIIIb

The size spectrum as tool for analyzing marine plastic pollution. *E. Marti et al.*

XIIIc

Automated analysis of µFTIR imaging data for microplastic samples. *S. Primpke et al.*

XIIId

Combined Effects of UV Exposure Duration and Mechanical Abrasion on Fragmentation and Particle Size Distribution of Polyethylene, Polypropylene and Expanded Polystyrene. *W. J. Shim et al.*

XIIIf

Solar radiation induced degradation of common plastics under marine exposure conditions. *A. Andrade et al.*

XIIIf

Using the FlowCam to validate an enzymatic digestion protocol applied to assess the occurrence of microplastics in the Southern North Sea. *C. Lorenz et al.*

XIIIf

DNA from the 'Plastisphere': an extraction protocol for ocean microplastics. *P. Debeljak et al.*

XIIIf

Quality assurance in microplastic detection. *C. Wesch et al.*

17h30-19h Posters and side event “Sharing Responsibilities”

19h Conclusions: Lanzarote's Declaration

Posters

Dear participants, All posters can be hung up starting the morning of May 25th at 9h after registration. They must be removed by 19h on Friday the 27th.

-Note: Posters are listed in alphabetical order of 1st author, please keep the poster number in mind for the posters contest-.

The Poster Awards will be announced on the 26th at 20h27'
during the Public Keynote: "Dialogue between natural and social sciences".

Are the densities of microplastics altered following interactions with *Elminius modestus* and sediment particles? R. Adams et al., poster number 102175

Macro- and micro-plastic in seafloor habitats around Mallorca. C. Alomar et al., poster number 102179

Evaluation of microplastics in Jurujuba Cove, Niterói. F. Araujo et al., poster number 94158

Presence, distribution and characterization of microplastics in commercial organisms from Adriatic Sea. C-G Avio et al., poster number 101916

The origin and fate of microplastics in saltmarshes. H. Ball et al., poster number 101818

Effects of microplastics and mercury, alone and in mixture, on the European sea bass (*Dicentrarchus labrax*): swimming performance and sub-individual biomarkers. L-G Barboza et al., poster number 101915

DNA damage evaluation of Polyethylene microspheres in *Daphnia magna*. A. Berber et al., poster number 102315

LITTERBASE - An online portal for marine litter and microplastics and their implications for marine life. M. Bergmann et al., poster number 102482

PLASTOX: Direct and indirect ecotoxicological impacts of microplastics on marine organisms. A. Booth et al., poster number 95410

Community-based Observatories tackling MICROPLASTIC: Spanish schools pilot project based on seawatchers.org. E. Broglio et al., poster number 101794

Tackling marine litter: Awareness and outreach in the Azores. R. Carriço et al., poster number 103441

MICRO 2016 Programme

Prevalence of microplastics in the marine waters of Qatar's Exclusive Economic Zone (EEZ). *A. Castillo et al.*, poster number **100223**

Microplastics contamination in three planktivorous and commercial fish species. *F. Collard et al.*, poster number **100959**

Spatial variation of microplastic ingestion in *Boops boops* in the Western Mediterranean Sea. *M. Compa et al.*, poster number **102142**

Source, transfer and fate of microplastics in the northwestern Mediterranean Sea: a holistic approach. *M. Constant et al.*, poster number **102220**

Microplastics in the final ocean frontier. *W. Courtene-Jones et al.*, poster number **99166**

Exposure @ Sea: the dynamic bacterial colonization of plastic. *C. De Tender et al.*, poster number **111705**

Microplastic abundance and distribution in the intertidal and subtidal marine environment around a major urban park in Vancouver, Canada. *A. Diaz et al.*, poster number **102008**

Microplastic ingestion by decapod larvae. *E. Fileman et al.*, poster number **101119**

May polystyrene microparticles affect mortality and swimming behaviour of marine planktonic invertebrates? *Ch. Gambardella et al.*, poster number **101801**

Improvement of microplastic extraction method in organic material rich samples. *P. Garrido Amador et al.*, poster number **102239**

PCB depuration via MP? A feeding experiment with *Daphnia magna*. *Z. Gerdes et al.*, poster number **102358**

Defining the Baselines and standards for Microplastics Analyses in European Waters (JPI-O BASEMAN). *G. Gerds, poster number 100987*

Effects of long term exposure with contaminated and clean micro plastics on *Mytilus edulis*. *T. Hamm, poster number 102416*

The City of Kuopio and Lake Kallavesi in the Finnish Lake District a 'living laboratory' for the microplastic pollution research in freshwater lakes. *S. Hartikainen et al., poster number 102292*

MICRO 2016 Programme

Analysis and quantification of microplastics in the stomachs of common dolphin (*Delphinus delphis*) stranded on the Galician coasts (NW Spain). A. Hernandez-Gonzalez *et al.*, poster number **99376 and 101623**

First report of microplastics in bycaught pinnipeds. G. Hernandez-Milian *et al.*, poster number **102200**

Preliminary results of Microtrophic Project. A. Herrera *et al.*, poster number **101570**

The Contribution of Citizen Scientists to the Monitoring of Marine Litter. V. Hidalgo-Ruz *et al.*, poster number **103474**

Non-target screening of organic substances in plastic marine debris and its new products. S. H. Hong *et al.*, poster number **102062**

Experimenting on settling velocity of cylindrical microplastic particles. I. Isachenko *et al.*, poster number **101528**

WEATHER-MIC - How microplastic weathering changes its transport, fate and toxicity in the marine environment. A. Jahnke *et al.*, poster number **91388**

Expanded polystyrene debris as a source of hazardous additives for their inhabiting organisms. M. Jang *et al.*, poster number **102242**

Formation of microplastics by lugworm inhabiting in expanded polystyrene marine debris. M. Jang *et al.*, poster number **102245**

Uptake of textile polyethylene terephthalate microplastic fibres by freshwater crustacean *Daphnia magna*. A. Jemec *et al.*, poster number **103222**

Assessment of microplastics toxicity from the acute and chronic exposure to *Cyprinodon variegatus*. Y-J Jung *et al.*, poster number **102096**

Microplastic distribution on two northwestern Mediterranean beaches. P. Kerhervé *et al.*, poster number **102341**

The depth profile of buoyant microplastics: How much does sea surface sampling overlook? M. Kooi *et al.*, poster number **102324**

Effects of microplastics on digestive enzymes in the marine isopod *Idotea emarginata*. Š. Korez *et al.*, poster number **102408**

MICRO 2016 Programme

Sinking behaviour of microplastics. *N. Kowalski et al.*, poster number **100878**

Characteristics of Plastic in stomachs of Northern Fulmars (*Fulmarus glacialis*). *S. Kihm et al.*, poster number **100942**

Microplastic sampling in the Mediterranean Sea. *J. Larsen et al.*, poster number **101871**

Pilot study on microlitter in the surface waters of the Gulf of Finland, Baltic Sea. *K. Lind et al.*, poster number **101411**

Persistent Organic Pollutants adsorbed on microplastics from the North Atlantic gyre. *M. Martignac et al.*, poster number **102442**

First evidence of microplastics in the ballast water of commercial ships. *M. Matiddi et al.*, poster number **101548**

Microlitter abundance in the Italian Minor Islands, Central Mediterranean Sea. *M. Matiddi et al.*, poster number **101615**

In search of the plastic accumulation regions: fine-tuning ocean surface transport models. *R. McAdam et al.*, poster number **101799**

Closing the gap between small and smaller: Towards an analytical protocol for the detection of Micro- and Nanoplastics in freshwater systems. *S. Mintenig et al.*, poster number **102484**

Preliminary assessment of the microplastic presence in the Gulf of Genoa (Italy, Ligurian Sea, Northwestern Mediterranean Sea). *S. Morgana et al.*, poster number **101802**

Toxicity assessment of pollutants sorbed on microplastics using various bioassays on two fish cell lines. *B. Morin et al.*, poster number **102337**

Fate of microplastics in soft marine sediments. *P. Nakkki et al.*, poster number **102107**

Microplastic as a vector of chemicals to fin whale and basking shark in the Mediterranean Sea: A model-supported analysis of available data. *C. Panti et al.*, poster number **101611**

Methodological prerequisites for toxicity testing of microplastics using marine organisms. *J-W Park et al.*, poster number **102067**

POPs adsorbed on plastic pellets collected in the Adriatic region. *M. Pfleger et al.*, poster number **102271**

MICRO 2016 Programme

Retrospective study [2000-2014] of the impact of foreign body in cetaceans stranded on the Canary Islands. *R. P. Puig Lozano et al.*, poster number **81459**

The EPHEMARE Project: Ecotoxicological Effects of Microplastics in Marine Ecosystems. *F. Regoli*, poster number **101391**

Suspended micro-sized PVC particles impair the performance and decrease survival in the Asian green mussel *Perna viridis*. *S. Rist*, poster number **101884**

Priority pollutants in microplastics from beaches in Gran Canaria Island. *M. Rodrigo et al.*, poster number **88302**

Plastic debris in Mediterranean seabirds. *A. Rodríguez et al.*, poster number **110743**

Monitoring plastic ingestion in selected Azorean marine fauna: Azorlit preliminary data. *Y. Rodriguez et al.*, poster number **101934**

Catching a glimpse of the lack of harmonization regarding techniques of extraction of microplastics in marine sediments. *E. Rojo-Nieto et al.*, poster number **96241**

Marine Litter Action Plan for Lanzarote: An exercise from the MOOC on marine litter offered by the open university of the Netherlands and the UNEP. *N. Ruckstuhl et al.*, poster number **101822**

Floating plastics in the sea: People's perception in the Majorca island (Spain). *L. Ruiz Orejon et al.*, poster number **101076**

Plastics in the Mediterranean Sea surface: From regional to local scale. *L. Ruiz Orejon et al.*, poster number **101081**

Analysis of organic pollutants in micro-plastics. *S. Santana-Viera et al.*, poster number **101858**

Sewage treatment plants as pathways for microlitter to the marine environment? A study from three Nordic countries. *O. Setälä et al.*, poster number **102165**

From the sea to the dining table and back to the environment: microlitter load of common salts. *O. Setälä et al.*, poster number **102227**

Sandy beaches microplastics of the Crimea Black Sea Coast. *E. Sibirtsova et al.*, poster number **100994**

MICRO 2016 Programme

Plastic prey; are fish post-larval stages ingesting plastic in their natural environment? *M. Steer et al.*, poster number **101113**

Microplastic ingestion by planktivorous fishes in the Canary Current. *A. Štindlová et al.*, poster number **102530**

Effects of microplastics on benthic macroinvertebrates in freshwater ecosystems. *L. Stuurman et al.*, poster number **102472**

First quantification of microplastic in Norwegian fjords through non disruptive ad-hoc sampling. *M. Svendsen Nerheim et al.*, poster number **103400**

Abundance of microplastics and adhered contaminants in the North Atlantic Ocean. *K. Syberg et al.*, poster number **101866**

Bioplastic and microbes. *V. Turk et al.*, poster number **102595**

Marine litter monitoring for coastal management indicator system development: citizen science and collaboration communication approach. *J. Ulme et al.*, poster number **110276**

Types and concentration of microplastics found on remote island beaches during the Race for Water Odyssey. *K. Van Arkel et al.*, poster number **99434**

A throwaway society: Is science stuck with single use plastic? What can we do about it? *A. Watts et al.*, poster number **100868**

Linking education and science to increase awareness of marine plastic litter - Distribution of plastic waste on beaches of the German Bight. *A. Wichels et al.*, poster number **98897**

Are smaller microplastics underestimated? Comparing anthropogenic debris collected with different mesh sizes. *A. Wilson Mc Neal et al.*, poster number **100984**

Precipitation/Flotation Effect of Coagulant to microplastics in water. *M. Yurtsever et al.*, poster number **105617**

Personal care and cosmetics products (PCCPs): Is it cleaning or pollution? *M. Yurtsever et al.*, poster number **105618**

Detection of microplastics with stimulated Raman scattering (SRS) microscopy. *L. Zada et al.*, poster number **102003**

25TH, 26TH AND 27TH MAY 2016

MICRO2016

INTERNATIONAL CONFERENCE
LANZAROTE

Fate and Impact of Microplastics in Marine Ecosystems: From the Coastline to the Open Sea

Hosted by:

Under the patronage of UNESCO
